KSBound: Kernel Stick-Breaking Prior Distribution for Spatial Boundary Detection

KSBound_Example

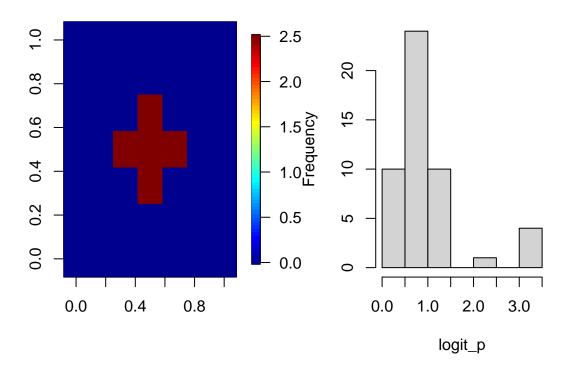

- [1] Simulate data from the proposed model:
 - Setting the reproducibility seed and initializing packages for data simulation:

```
set.seed(3357)
library(KSBound)
library(mnormt) #Multivariate normal distribution
## Warning: package 'mnormt' was built under R version 4.3.0
library(fields)
## Warning: package 'fields' was built under R version 4.3.1
## Loading required package: spam
## Warning: package 'spam' was built under R version 4.3.1
## Spam version 2.9-1 (2022-08-07) is loaded.
## Type 'help( Spam)' or 'demo( spam)' for a short introduction
## and overview of this package.
## Help for individual functions is also obtained by adding the
## suffix '.spam' to the function name, e.g. 'help( chol.spam)'.
## Attaching package: 'spam'
## The following objects are masked from 'package:base':
##
##
       backsolve, forwardsolve
## Loading required package: viridis
## Warning: package 'viridis' was built under R version 4.3.1
## Loading required package: viridisLite
## Warning: package 'viridisLite' was built under R version 4.3.1
##
## Try help(fields) to get started.
  • Creating a Grid:
n.space < -7
x.easting<-1:n.space
x.northing<-1:n.space
Grid<-expand.grid(x.easting,</pre>
                  x.northing)
K<-nrow(Grid)</pre>
distance<-as.matrix(dist(Grid))</pre>
W \leftarrow array(0, c(K,K))
W[distance == 1] <-1 #Rook definition
diag(W) < -0
```

• Simulating Data:

```
offset<-rep(0,
             times = nrow(W))
beta_true<-c(0.75,
              -0.35)
r_true<-50.00
#Design Matrix
x<-matrix(1,</pre>
          nrow = nrow(W),
          ncol = 2)
x[,2]<-scale(rnorm(n = nrow(W)))
#Simulating the Data
phi<-rep(0,</pre>
         times = nrow(W))
center<-25
phi[W[center,] == 1] <-phi[W[center,] == 1] +</pre>
                        2.50
phi[center] <-phi[center] +</pre>
              2.50
neighbor_set<-c(1:nrow(W))[W[center,] == 1]</pre>
par(mfrow = c(1,2))
image.plot(matrix(c(phi),
                   nrow = n.space,
                   ncol = n.space,
                   byrow=TRUE))
logit_p<-x%*%beta_true +</pre>
         phi
hist(logit_p)
```

Histogram of logit_p

[2] Fit KSBound to estimate spatial boundaries:

Progress: 10%
Progress: 20%
Progress: 30%
Progress: 40%
Progress: 50%
Progress: 60%
Progress: 70%
Progress: 80%
Progress: 90%
Progress: 100%

[3] Analyzing Output:

```
par(mfrow=c(2,2))
plot(results$beta[1, 5001:25000],
     type="1",
     ylab="beta",
     xlab="Sample")
abline(h=beta_true[1],
       col="red",
       lwd=2) #True value
plot(results$beta[2, 5001:25000],
     type="1",
     ylab="beta",
    xlab="Sample")
abline(h=beta_true[2],
       col="red",
       lwd=2) #True value
plot(results\r[5001:25000],
     type="1",
     ylab="r",
     xlab="Sample")
abline(h=r_true,
       col="red",
       lwd=2) #True value
plot(rowMeans(results$theta_g[,5001:25000]),
     pch=16,
     ylab="eta",
    xlab="Time",
    ylim = c(-1,3))
points(phi,
       pch=16,
       col="red") #True values
```
